PIA3121 Theories of International Relations — Week 3 Summary: Liberalism and Neo-Liberalism

1. Week Framing: Where Liberalism Sits in the Course

Keywords: liberalism, neoliberalism, realism, neo-neo debate, midterm quiz, Viotti & Kauppi

- Lecture of 15 Sep 2026: **Liberalism and Neo-Liberalism**, the first half of "Liberalism and Neoliberalism vs. Realism and Neorealism" (Slide 1).
- Reading: Viotti & Kauppi, "Liberalism: Interdependence and Global Governance".
- Course arc (Slide 2): Tools of Analysis (1 Sep) → Realism (8 Sep) → **Liberalism (15 Sep)** → Neorealism and Neoliberalism (22 Sep) → Economic Structuralism and Globalization (29 Sep) → Constructivism (6 Oct) → **MIDTERM QUIZ (13 Oct)**.
- After the midterm: Ontological Security Theory, English School, Democratization / Global Culture / Revolution, Critical Theory / Gender / Global Civil Society, Chaos and Complexity / Existential Risks; final quiz due 24 Nov; group paper due 8 Dec (Slide 2).
- Two halves to the lecture:
    - **Classical liberalism**: Hobbes as foil → Locke → the jurists → Kant → Smith and Ricardo, then a historical check on whether liberal ideas actually produced peace (Slides 3–53).
    - **Neoliberalism**: the 20th-century theory timeline and Little's "Three Key Discoveries" (state fragmentation, transnationalism, interdependence), ending on the global commons (Slides 54–83).
- → **Study cue:** every liberal idea is built as an answer to Hobbes's anarchy. Learn each thinker as "what Hobbes said / what X replied".

2. Hobbes: The Pessimistic Baseline (Slides 3–7)

Keywords: Leviathan 1651, state of nature, anarchy, security dilemma, early international lawyers

2.1 The Argument of Leviathan

Keywords: solitary poor nasty brutish short, sovereign, order, prosperity

- Hobbes 1651, *Leviathan*. Slide 3 shows Hobbes's portrait and the famous frontispiece: a giant sovereign whose body is made of many small people, i.e. the state as the combined, authorised power of its subjects.
- **State of nature:** life is "solitary, poor, nasty, brutish, and short" (Slide 4) (memorise the quote).

- **Domestic solution:** the state (Leviathan) **provides order**, and order produces **prosperity and security** (Slide 5).
- **International problem:** there is **no overarching state** above states, only **anarchy and security dilemmas (SDs)** (Slide 6).
    - Anarchy: the absence of any authority above sovereign states.
    - Security dilemma: one state's efforts to make itself secure make others feel insecure, so they arm in turn and everyone ends up less safe (standard definition, Week 2 realism).

2.2 Hobbes vs the International Lawyers

Keywords: naïve optimism, Grotius, natural law, realist ancestry

- Hobbes is **challenging the early international lawyers**, suggesting their optimism about law between states is **naïve** (Slide 7).
- → Liberalism's founding question follows: *can states cooperate, and can peace last, without a world Leviathan?* Hobbes says no; every liberal on the following slides says "yes, under conditions".
- One-liner: **Hobbes = order requires a sovereign; no world sovereign = permanent anarchy.**

3. John Locke: The Early Liberal Optimist (Slides 8–17)

Keywords: Two Treatises of Government 1689, social nature, limited state, life liberty property, Law of Nature

3.1 Two Treatises of Government (Slides 8–11)

Keywords: inherently social, not a security dilemma, social contract, limited government

- Locke 1689, *Two Treatises of Government*; the slide labels him an **"early Liberal optimist"** (Slide 8).
- Three steps (Slides 9–11):
    - **The state of nature is NOT that bad**, because humans are **inherently social**. The state of nature is **NOT a security dilemma** (Slide 9).
    - Individuals still **contract** with each other and with a state **to make things even better**, so government is an improvement, not a rescue from hell (Slide 10).
    - The state must be **limited in its powers**, because its purpose is to **preserve the life, liberty, and property** of individuals (Slide 11).
- → Contrast with Hobbes: for Hobbes the state is a necessary absolute power; for Locke it is a limited trustee of individual rights. This is the root of the liberal concern with **individual rights and constrained government**.

3.2 Anarchy as Society, Not War (Slides 12–14)

Keywords: Law of Nature, international society, inconvenience, impartial judge

- **State of nature is a society, not war:** against Hobbes's "war of all against all", Locke saw the state of nature **between nations** as a **society** governed by a moral **"Law of Nature"** (Slide 13).
- **Anarchy is "inconvenient", not hellish:** the problem with international anarchy is not constant brutal warfare but the "inconvenience" of lacking an impartial judge to settle disputes (Slide 14) (memorise the word "inconvenience").
- *Example:* two states disputing a border are not automatically at war; the problem is that no neutral court can decide who is right, so each judges its own case.

3.3 Natural Law, War and "Realistic Liberalism" (Slides 15–17)

Keywords: natural law, treaties, war as specific act, realistic liberalism, prudence

- **Natural law binds states:** states, like individuals, are bound by a universal moral law discoverable by reason, which creates a basis for **treaties and international law** (Slide 15).
- **War is a specific act, not a constant state:** Hobbes saw war as the **default** condition; Locke defined war as a specific, unjust act of aggression, a deviation from the natural state of peace (Slide 16).
- **Basis for Realistic Liberalism:** a middle ground where cooperation is **possible and morally grounded**, but the reality of anarchy still requires states to be **prudent** and **prioritise self-preservation** (Slide 17).
- → Locke concedes anarchy (like realists) but denies that anarchy means war (unlike realists).
- One-liner: **Locke = anarchy is an inconvenience, not a war; states share a moral law; cooperation is possible but prudence still rules.**

4. Locke and the International Jurists: Grotius and Pufendorf (Slides 18–23)

Keywords: Grotius, Pufendorf, Vattel, natural law, state of nature, regulation of conflict

Locke's relationship to the jurists who founded international law (Grotius, Pufendorf), in five points (Slides 19–23):

- **Agreement 1 — States are in a state of nature:** Locke adopted the jurists' core framework; sovereign nations exist in an **anarchic state of nature** relative to one another (Slide 19).
- **Agreement 2 — Natural law governs all:** this state of nature is **not a lawless void** but is governed by a universal Law of Nature applying to **states as well as individuals** (Slide 20).

- **Refinement — From states to individuals:** Locke's key innovation was to take the "state of nature" concept, which jurists used **for states**, and apply it rigorously **to individuals**, building his theory of government from the ground up (Slide 21).
- **Implicit disagreement — The purpose of the law:** jurists aimed at a **legal code to manage and regulate conflict**; Locke aimed at explaining **why the state of nature itself is flawed** and must be **transcended** (at least for individuals) through a **social contract** (Slide 22).
- **Influence on the next generation:** Locke's **rights-based** philosophy shaped later jurists such as Vattel, shifting the focus towards **state sovereignty and equality** (Slide 23).
- → **Regulate war** (jurists) vs **escape the condition that produces it** (Locke, then Kant). This distinction sets up Kant's attack on the jurists in Section 5.

5. Kant: Perpetual Peace (Slides 24–29)

Keywords: perpetual peace, moral duty, pacific federation, republics, democratic peace, cosmopolitan law

5.1 Peace as a Moral Duty and the Pacific Federation (Slides 25–26)

Keywords: abolition of war, voluntary league, no world government

- **Perpetual peace as a moral duty:** Kant moved beyond **managing** conflict; humanity has a **moral obligation** to work towards the **complete abolition of war** and establish a "perpetual peace": a permanent end to war, not a pause between wars (Slide 25).
- **The "Pacific Federation" of republics:** a voluntary league of free, republican states that agree to resolve disputes peacefully; Kant **rejects a coercive world government** (Slide 26).
- → Kant solves anarchy **without** a world Leviathan, which is the key difference from Hobbes's logic.

5.2 Democratic Peace (Slide 27)

Keywords: republican states, consent of citizens, costs of war, peace among democracies

- Democratic Peace Theory: Kant's core insight that republican (democratic) states, where the citizens who bear the costs of war must consent to it, are inherently more peaceful, especially towards each other (Slide 27) (memorise).
- Mechanism: those who pay in taxes and lives get a say, so they rarely choose war.
- → Revived in the 1990s as the "democratic peace hypothesis" (Slide 54, Section 9).

5.3 "Miserable Comforters" and Cosmopolitan Law (Slides 28–29)

Keywords: critique of jurists, legitimising war, universal hospitality, travel and trade, interdependence

- **Jurists as "miserable comforters":** Kant dismissed earlier jurists (Grotius, Pufendorf, Vattel) because they merely **codified the rules of war**, which **legitimised war as a tool of statecraft** instead of seeking to eliminate it (Slide 28).
- **Cosmopolitan law and universal hospitality:** a global law protecting individuals' right to travel and trade freely, fostering **interdependence** as another **pillar of peace** (Slide 29).
- Kant's three pillars of peace: **republics** + **federation** + **cosmopolitan law / commerce**.
- One-liner: **Kant = peace is a duty; republics + voluntary federation + free movement and trade make it permanent.**

6. The Intellectual Path from Locke to Kant (Slides 30–35)

Keywords: inconvenience of anarchy, federative power, social contract between states, moral imperative

Five-step chain (memorise the sequence):

1. **Locke's problem — anarchy's "inconvenience":** with no impartial judge in the international state of nature, **peace is fragile even with a governing moral law** (Slide 31).
2. **Locke's solution — pragmatic and incomplete:** for states, prudent self-interest through **treaties and alliances**, i.e. the "federative power": the state's power to conduct external relations, make treaties and alliances, and decide war and peace. But he offered **no way for nations to exit the state of nature** as individuals could (Slide 32).
3. **Kant takes up the challenge:** he starts from Locke's problem, finds the pragmatic solution **insufficient**, and seeks a **systematic, permanent** solution to the "inconvenience" of anarchy (Slide 33).
4. **Kant's solution — a contract between states:** the Pacific Federation is essentially a social contract for nations, applying Locke's **domestic** solution to the **international** realm; states **voluntarily cede their right to wage war** (Slide 34).
5. **From natural law to moral imperative:** Kant turns Locke's rational Law of Nature into an **absolute moral duty**; perpetual peace becomes **the ultimate goal of political reason**, not just a good idea (Slide 35).

- → Locke lets individuals leave the state of nature by contract; Kant lets **states** leave it the same way.

7. Smith and Ricardo: Commercial Liberalism (Slides 36–41)

Keywords: harmony of interests, invisible hand, absolute advantage, comparative advantage, anti-mercantilism, trade vs empire

7.1 Adam Smith (Slides 37–38)

Keywords: harmony of interests, invisible hand, mercantilism, specialisation

- Harmony of Interests (Smith): as with the "invisible hand" in domestic markets, nations pursuing their economic self-interest through free trade unintentionally create a more peaceful and prosperous international order (Slide 37).
- **Absolute advantage and anti-mercantilism** (Smith): attacked the realist/mercantilist view that **wealth is finite** and best gained by **conquest or hoarding** (Slide 38).
    - Mercantilism: the doctrine that national wealth and power come from accumulating gold and running trade surpluses, so one state's gain is another's loss (zero-sum) (standard definition).
    - Absolute advantage: a nation should specialise in what it produces most efficiently and trade for the rest, so all nations get richer.

7.2 David Ricardo (Slide 39)

Keywords: comparative advantage, mutual gain, cooperation over conflict

- Comparative Advantage (Ricardo): free trade is mutually beneficial even when one nation is more productive in every good, as long as each specialises in what it gives up least to produce (Slide 39) (memorise).
- Stronger case for free trade than Smith's, giving a compelling **economic logic for cooperation over conflict**.
- *Example:* standard textbook case: Portugal is better than England at both wine and cloth, but is *relatively* better at wine; if Portugal makes wine and England cloth and they trade, both end up with more.

7.3 Trade Is Cheaper than Empire (Slides 40–41)

Keywords: cost of conquest, interdependence, costs of war, commercial liberalism

- **Trade is cheaper than empire:** it is **more profitable to trade** for resources than to **conquer and rule** the territories holding them, which removes a primary historical justification for war (Slide 40).
- **Foundation of Commercial Liberalism:** deep economic interdependence and an open trading system raise the costs of war so high that war becomes an irrational choice for modern states (Slide 41) (memorise).
- → Realism/mercantilism treats wealth as **zero-sum** (relative gains); commercial liberalism treats it as **positive-sum** (absolute gains). This divide returns in the neo-neo debate next week.

8. Why It Mattered: Early Modern War (Slides 42–48)

Keywords: wars of religion, Thirty Years' War, Napoleonic Wars, famine, disease, displacement

8.1 The Death Toll (Slide 42)

Keywords: casualty estimates, 1562–1815, motivation for liberal theory

The liberal search for a **permanent** end to war was not an empty academic exercise. Estimated deaths (Slide 42):

- French Wars of Religion (1562–1598): **2–4 million**.
- Eighty Years' War / Dutch Revolt (1568–1648): **600,000–700,000**.
- **Thirty Years' War (1618–1648): 4.5–8 million**, the worst on the list.
- Wars of Louis XIV: about **2 million** for the War of the Spanish Succession (1701–1714) alone.
- Great Northern War (1700–1721): about **350,000** (military and civilian).
- War of the Austrian Succession (1740–1748): about **500,000**.
- Seven Years' War (1756–1763): **0.9–1.4 million**.
- French Revolutionary and Napoleonic Wars (1792–1815): **3.5–7 million**.
- → Locke (1689), Smith (1776) and Kant (1795) all wrote in the middle of this sequence.

8.2 How People Died (Slides 43–48)

Keywords: living off the land, typhus, refugees, razing, long-term decline

- **Killed on the battlefield**: "of course", but not the main killer (Slide 44).
- **Famine and starvation:** poorly supplied armies **"lived off the land"**, stripping whole regions of food, livestock and grain and starving civilians; the **Thirty Years' War** was infamous for this (Slide 45).
- **Disease:** unsanitary camps bred **typhus, dysentery and smallpox**; moving armies spread epidemics among malnourished civilians. **Disease almost always killed far more people than combat** (Slide 46) (memorise).
- **Displacement and exposure:** people fled approaching armies as **refugees** and died of exposure, hunger and violence on the move (Slide 47).
- **Destruction of infrastructure:** razed villages, destroyed crops and disrupted trade routes **crippled communities for decades**, causing further population decline (Slide 48).
- → War's costs fell mostly on **civilians**, which is why Kant's argument that those who bear the costs should consent to war carried moral weight.

9. The "Long Peace" of 1815–1914: A Liberal Peace? Nope. (Slides 49–53)

Keywords: Concert of Europe, balance of power, conservative monarchies, British hegemony, offshore balancer, WWI, 1913 interdependence

The lecturer's counter-argument: the century of relative great-power peace after Napoleon does **not** show that liberal ideas worked.

- **The Concert of Europe:** not a liberal institution built on a harmony of interests, but an **exclusive club of great powers** (Britain, Russia, Prussia, Austria, France) designed to

manage the balance of power, enforce treaties, and stop any one nation dominating the continent as Napoleon had (Slide 50).

- **Shared conservative interests:** in the early decades the key members (Austria, Prussia, Russia) aimed to **suppress liberal and nationalist revolutions**, the very movements that might have created Kantian-style republics. It was a peace to **protect monarchies**, not promote liberal values (Slide 51).
- **British hegemony:** the system was underwritten by Britain as an "offshore balancer": a dominant power outside the continent that intervenes only to stop any continental rival from becoming dominant. The **Royal Navy** kept sea lanes open for the trade liberals prized, but was also an **instrument of power** to check rising challengers (Slide 52).
- **The ultimate failure (WWI): 1913** was a historic **peak of global economic interdependence**. If commercial liberalism were a **sufficient** cause of peace, **World War I should never have happened** (Slide 53) (memorise).
- → The 1815–1914 peace is better explained **realistically** (balance of power, hegemony, great-power management) than liberally.
- One-liner: **interdependence peaked in 1913 and war came in 1914, so trade alone is not sufficient for peace.**

10. 20th/21st-Century Western IR Theory: Timeline (Slide 54)

Keywords: idealism, realism, transnational relations, neoliberalism, neo-neo debate, end of history, power transition

- **1919–39:** Liberalism, or **"Idealism"**, dominant (League of Nations era).
- **1939–69: Realism dominant**, except for a late-1940s interlude; realists mock liberals as "idealists".
- **1970s:** discovery of **transnational relations and interdependence** gives rise to Neoliberalism.
- **1979–89:** emergence of the Neo-Neo Debate: the debate between neorealists and neoliberals over anarchy, cooperation and relative vs absolute gains (topic of Week 4).
- **1990s:** Fukuyama's **"End of History"**; the **democratic peace hypothesis** (Kant revived); Constructivism; Critical Theory; Feminist IR Theory.
- **2000s–2010s: return of Realism**, especially Power Transition Theory.
- → Liberalism and realism alternate in dominance; neoliberalism is a 1970s reaction to **observed facts** (transnationalism, interdependence), not only to ideas.
- Note: "neoliberalism" here is the **IR theory** of institutions and interdependence, not the free-market economic policy of the same name.

11. Little's "Three Key Discoveries" and the Realist Picture (Slides 55–57)

Keywords: Richard Little, state fragmentation, transnationalism, interdependence, billiard ball model, cobweb model, anarchy

11.1 The Three Discoveries (Slide 55)

Keywords: neoliberal findings, 1960s–70s, challenge to realist assumptions

Little: three discoveries made by neoliberals in the 1960s and '70s (Slide 55) (memorise all three, in order):

6. **State fragmentation**: the state is not a single unified actor (Section 12).
7. **Transnationalism**: non-state actors and flows cross borders (Section 13).
8. **Interdependence**: states depend on and are vulnerable to each other (Section 14).

11.2 Billiard Balls vs Cobweb (Slides 56, 68)

Keywords: unitary state, collisions, web of ties, complex interdependence

- **Realist view = billiard balls** (Slide 56): states are hard, **unitary**, sealed units that interact only by **colliding** (force, war, diplomacy). What happens inside the ball does not matter.
    - Billiard Ball Model: states as closed, unitary actors interacting only through external contact.
- **Neoliberal view = cobweb** (Slide 56): a dense, multi-coloured **web or lattice of transnational ties** linking societies, groups and individuals across borders.
    - Cobweb Model: world politics as overlapping networks of transactions among many actors, not just states; the picture behind Complex Interdependence.
- The same image returns at Slide 68 to introduce transnationalism.
- → Each of Little's discoveries breaks the billiard ball: fragmentation **opens the ball**, transnationalism **adds threads between societies**, interdependence **ties the balls together**.

11.3 "ANARCHY!" (Slide 57)

Keywords: levels of analysis, system level, realist explanation

- Slide 57: a **levels-of-analysis** diagram (individual / state / system, from Week 1) with **"ANARCHY!"** at the system level.
- Realists explain state behaviour mainly from the **system level**, where anarchy is the single driving condition.
- → Neoliberals pull analysis **down** to the state and society levels (fragmentation) and **across** borders (transnationalism), and argue that the system holds more than anarchy (interdependence).

12. Discovery 1: State Fragmentation (Slides 58–65)

Keywords: pluralism, interest groups, bureaucratic politics, unitary rational actor

12.1 A Fractured Society (Slides 58–60)

Keywords: special interest groups, pluralism, domestic politics shapes foreign policy

- Political scientists began portraying US society as "fractured into jumbles of hundreds of small special interest groups, with incompletely overlapping memberships, widely differing power bases, and a multitude of techniques for exercising influence" (Slide 59).
- *Example:* Slide 60, a screenshot of the election game **"The Political Machine"**, where candidates chase interest-group endorsements. → Foreign policy is shaped by **domestic pluralism** and lobbying, not a single national interest.

12.2 Bureaucratic Politics (Slides 61–62)

Keywords: coherent state, rational actor, agencies, organisational interests

- Next, political scientists chipped away at the realist image of the **coherent state as a rational actor**, because of **bureaucratic politics** (Slide 61).
    - Bureaucratic Politics: policy is the outcome of bargaining among government agencies with their own interests, not a single rational calculation (standard context).
- *Example:* Slide 62, the **US government organisation chart**: Constitution → legislative / executive / judicial branches → dozens of departments and agencies. → The "state" is a **fragmented collection of organisations**, not one decision-maker.
- *Example:* standard illustration: defence, trade and foreign ministries can push different policies towards the same country.

12.3 The Key Multi-Part Question (Slides 63–65)

Keywords: unified rational actor, variation by country, implications for realism

The likely exam-style question (Slides 63–65) (memorise):

- **Under what circumstances (if any) can the state be considered a unified rational actor?** (Slide 63)
- **Does the answer vary by state (country)?** (Slide 64)
- **What difference does the answer make for Realism, exactly?** (Slide 65)
- Points for an answer (consistent with the slides):
    - Unity is more plausible in **crises and existential threats**, or in **centralised states** with few veto players; less plausible in **pluralist democracies** like the US, with many interest groups and agencies (Slides 59–62).
    - Realism assumes the state is **unitary and rational** (billiard ball); if that assumption fails, realist predictions based only on anarchy and power lose force, and domestic politics must enter the explanation.

- One-liner: **fragmentation = there is no single "state" making choices; there are groups and agencies competing inside it.**

13. Discovery 2: Transnationalism (Slides 66–71)

Keywords: MNCs, transnational media, air travel, cross-border pollution, NGOs, globalisation data

13.1 New Actors and Flows (Slides 66–68)

Keywords: non-state actors, transnational relations, cobweb

- A new generation of IR analysts paid systematic attention to **MNCs, transnational media operations, jet air travel, cross-border pollution, and eventually NGOs** (Slide 67).
    - Transnationalism: interactions and organisations that cross state borders without being controlled by central governments (standard definition).
    - MNC (multinational corporation): a firm producing or operating in several countries.
    - NGO (non-governmental organisation): a private, non-profit group active on public issues, often across borders.
- Billiard ball vs cobweb image repeated (Slide 68): transnational links are the threads of the web.

13.2 The Evidence (Slides 69–71)

Keywords: airline traffic, telephone calls, export growth

- *Example:* **Global airline capacity and traffic, 1929–2018**: from near zero to about **8–9 trillion passenger-km** (Slide 69).
- *Example:* **International telephone calls, 1940–1970**: sharp rise (Slide 70).
- *Example:* **Growth of global exports, 1950–1985**, indexed to 1913: rising to about **1,300%** (Slide 71).
- → Postwar transnational interaction grew dramatically, which is exactly what 1970s neoliberals "discovered" and realists' state-centric models could not see.

14. Discovery 3: Interdependence (Slides 72–77)

Keywords: autonomy of states, trade openness, oil shocks, Russian gas, vulnerability

14.1 The Claim (Slides 72–73)

Keywords: realist assumption, autonomous actors, mutual dependence

- The discovery of interdependence demonstrated the inadequacy of the Realist assumption that states are autonomous actors in an anarchic world (Slide 73) (memorise).

- Interdependence: mutual dependence, where events or decisions in one country carry costs and effects for others (standard definition).
- Standard context from the reading (Keohane & Nye 1977, Complex Interdependence): sensitivity: how quickly and how much one country is affected by changes elsewhere vs vulnerability: how costly it is for a country to adjust or find alternatives.

14.2 Trade Data (Slides 74–75)

Keywords: exports as share of GDP, trade openness index, interwar collapse

- *Example:* **Exported goods as share of GDP, 1950–1985**: about **8% → 16%**, peaking around 1980 (Slide 74).
- *Example:* **Globalization over five centuries (trade openness index)**: about **20%** in the 1870s–1913, **interwar collapse** to about **10%**, then a rise to about **60% by 2008** (Slide 75).
- → Links back to Section 9: the 1913 peak was followed by WWI and collapse; postwar interdependence far exceeds 1913.

14.3 Interdependence as Vulnerability (Slides 76–77)

Keywords: oil price spikes, recession, energy dependence, Ukraine war

- *Example:* **US GDP growth vs oil prices, 1970–2000** (Slide 76): oil-price spikes in **1973–74, 1979–80 and 1990** coincide with **US recessions**. Even the strongest state's economy depends on decisions made abroad (e.g. OPEC).
- *Example:* **IMF map of Russian gas dependence** (Russian gas as % of total energy consumption, 2020) (Slide 77): highest in **Central/Eastern Europe** (e.g. Hungary, Slovakia), relatively high in **Austria, Germany, Italy**. Relevant to the **Ukraine war**: dependence became a lever and a vulnerability.
- → Interdependence does **not** only produce peace (Smith/Ricardo); it also creates **vulnerability** that can be used as power. Ties back to the 1913 lesson.

15. The Global Commons (Slides 78–83)

Keywords: global commons, atmosphere, oceans, outer space, Antarctic, climate change, collective governance

15.1 Definition (Slide 78)

Keywords: outside national jurisdiction, shared assets

- Neoliberals developed the concept of the Global Commons: "natural assets outside national jurisdiction such as the atmosphere, oceans, outer space, and the Antarctic" (Slide 78) (memorise the four examples).
- → Interdependence extends from economics to **shared environmental systems** that no single state owns or can protect alone, so their governance needs cooperation and institutions (the "global governance" of the reading's title).

15.2 Evidence of Strain (Slides 79–82)

Keywords: world map, global temperature, Arctic sea ice, satellite orbits

- *Example:* world political map: the commons lie beyond and across all borders (Slide 79).
- *Example:* **Global average temperature, 1850–2018**: rise of about **+1 °C** (Slide 80), the atmosphere as a commons.
- *Example:* **Arctic sea ice 2018**, March and September extents both **below the 1981–2010 median** edge (Slide 81).
- *Example:* **satellite orbit diagram**: **outer space** as a crowded global commons (Slide 82).

15.3 Governing the Commons: Tokyo Framework (Slide 83)

Keywords: Center for Global Commons, system transformations, action levers, commons domains

University of Tokyo **Center for Global Commons** framework (Slide 83), in three layers:

- **System transformations:** decarbonised energy / industry / transport; sustainable cities; sustainable production and consumption; sustainable food, land, water and oceans.
- **Action levers:** targets and institutions; economics and finance; social fairness; innovation and data.
- **Global commons domains to protect:** climate system, ozone layer, land biosphere, oceans, ice sheets and glaciers.
- → Liberal answer to shared problems: **institutions, targets, finance and innovation** coordinated across states, not each state pursuing power alone.
- Slide 84: attendance QR code only.

16. Liberalism vs Realism: Comparison Points

Keywords: human nature, anarchy, actors, gains, peace, cooperation

Bullet-form comparison, built from the week's slides:

- **Human nature / state of nature:** Hobbes, realist: brutish, war of all against all. Locke, liberal: social, a society under natural law (Slides 4, 9, 13).
- **Anarchy:** realist: permanent condition of insecurity and security dilemmas. Liberal: an "inconvenience" that treaties, federations and institutions can manage or overcome (Slides 6, 14, 34).
- **War:** realist: the default. Liberal: a specific unjust act, and abolishing it is a moral duty (Slides 16, 25).
- **Actors:** realist: unitary rational states (billiard balls). Neoliberal: fragmented states plus MNCs, media, NGOs (cobweb) (Slides 56, 59–67).
- **Economics:** realist/mercantilist: finite wealth, zero-sum, conquest. Liberal: specialisation, comparative advantage, trade cheaper than empire (Slides 38–40).

- **Sources of peace:** realist: balance of power and hegemony (Concert of Europe, Royal Navy). Liberal: republics, federation, cosmopolitan law, interdependence (Slides 26–29, 41, 50–52).
- **Test case against liberalism:** 1913 interdependence peak → WWI (Slide 53).
- → Exam technique: for any case, ask *what is the unit, what drives behaviour, and can cooperation last?* Realist and liberal answers diverge on all three.

17. Key Terms and One-Liners

Keywords: definitions, quick recall, midterm revision

- **Hobbes:** state of nature "solitary, poor, nasty, brutish, and short"; no world Leviathan → anarchy and SDs; jurists naïve (Slides 4–7).
- **Locke:** social humans; limited state for life, liberty, property; anarchy as "inconvenience"; war as specific act; Realistic Liberalism (Slides 9–17).
- **Jurists:** Grotius, Pufendorf regulate conflict; Vattel shifted to sovereignty and equality (Slides 19–23).
- **Kant:** perpetual peace as duty; Pacific Federation; Democratic Peace Theory; "miserable comforters"; cosmopolitan law (Slides 25–29).
- **Federative power:** Locke's treaty-and-alliance power, which manages anarchy but cannot exit it (Slide 32).
- **Smith/Ricardo:** Harmony of Interests; absolute advantage; Comparative Advantage; trade cheaper than empire; Commercial Liberalism (Slides 37–41).
- **Little's three discoveries:** state fragmentation, transnationalism, interdependence (Slide 55).
- **Global commons:** atmosphere, oceans, outer space, Antarctic (Slide 78).
- One-liners:
    - *Hobbes fears anarchy; Locke finds it inconvenient; Kant wants to abolish it by contract between republics.*
    - *Trade raises the cost of war, but 1913 shows it does not make war impossible.*
    - *Neoliberalism broke the billiard ball: open the state, add the threads, tie the states together.*

18. One-Page Revision Spine

Keywords: last-minute recap, classical liberalism, neoliberalism, Little, midterm

9. **Context:** Week 3 of the realism → liberalism → neo-neo sequence; midterm quiz 13 Oct covers Weeks 1–6; reading Viotti & Kauppi (Slides 1–2).
10. **Hobbes** (Hobbes 1651): life in the state of nature "solitary, poor, nasty, brutish, and short"; Leviathan gives order → prosperity and security; internationally no Leviathan → anarchy and security dilemmas; jurists' optimism naïve (Slides 3–7).
11. **Locke** (Locke 1689): humans social, state of nature NOT a security dilemma; contract to improve; state limited to preserving life, liberty, property (Slides 8–11).

12. **Locke on IR:** international state of nature = society under the Law of Nature; anarchy an "inconvenience" (no impartial judge); natural law binds states → treaties and international law; war a specific unjust act; Realistic Liberalism = cooperation possible but prudence needed (Slides 12–17).
13. **Locke and the jurists** (Grotius, Pufendorf): agreed states are in a natural-law-governed state of nature; Locke applied the concept to individuals; jurists regulate conflict, Locke transcends it via social contract; influenced Vattel towards sovereignty and equality (Slides 18–23).
14. **Kant:** perpetual peace a moral duty; voluntary Pacific Federation of republics, no world government; Democratic Peace Theory (citizens who bear the costs consent to war); jurists = "miserable comforters"; cosmopolitan law of hospitality, travel and trade → interdependence (Slides 24–29).
15. **Locke → Kant:** inconvenience of anarchy → federative power (pragmatic, no exit) → Kant seeks a permanent fix → social contract between states, ceding the right to war → natural law becomes moral imperative (Slides 30–35).
16. **Smith and Ricardo:** harmony of interests (invisible hand); absolute advantage vs mercantilism; comparative advantage (gain even if one is better at everything); trade cheaper than empire → Commercial Liberalism: interdependence makes war irrational (Slides 36–41).
17. **Why it mattered:** 1562–1815 wars killed millions (Thirty Years' War 4.5–8 m; Napoleonic 3.5–7 m); most died of famine, disease, displacement and ruined infrastructure; disease killed more than combat (Slides 42–48).
18. **Long Peace 1815–1914 not liberal:** Concert of Europe = great-power balance-of-power club; protected monarchies against liberal revolutions; British offshore balancing and the Royal Navy; 1913 interdependence peak → WWI, so commercial liberalism is not sufficient for peace (Slides 49–53).
19. **Timeline:** 1919–39 Idealism; 1939–69 Realism; 1970s neoliberalism from transnationalism and interdependence; 1979–89 neo-neo debate; 1990s End of History, democratic peace, constructivism, critical and feminist theory; 2000s–10s realism returns, power transition theory (Slide 54).
20. **Little's three discoveries:** state fragmentation, transnationalism, interdependence; realist billiard balls vs neoliberal cobweb; realists explain from system-level "ANARCHY!" (Slides 55–58, 68).
21. **State fragmentation:** US society fractured into hundreds of interest groups; bureaucratic politics undermines the coherent rational state (US org chart, Political Machine game); key question: when, if ever, is the state a unified rational actor, does it vary by country, and what does it mean for realism? (Slides 58–65)
22. **Transnationalism:** MNCs, media, jet travel, cross-border pollution, NGOs; airline traffic to 8–9 trillion km, phone calls surge 1940–70, exports to about 1,300% of 1913 by 1985 (Slides 66–71).
23. **Interdependence:** disproves realist assumption of autonomous states; exports 8% → 16% of GDP 1950–85; trade openness 20% (1913) → 10% (interwar) → 60% (2008);

oil shocks → US recessions; Russian gas dependence in Europe → interdependence as vulnerability (Slides 72–77).

24. **Global commons:** natural assets outside national jurisdiction: atmosphere, oceans, outer space, Antarctic; warming about +1 °C, shrinking Arctic ice, crowded orbits; Tokyo framework of transformations, levers and commons domains → cooperative global governance (Slides 78–83).
